■ Task 1 — Presentation

The Phish Tank Simulator

■■ Exported Presentation Images

Image 1 — The Art of Phishing

A cybersecurity awareness poster highlighting how phishing attacks lure users into entering their login credentials through fake forms and unsolicited links. Key message: Think Before You Click.

Image 2 — Phishing: What You Need to Know

An infographic explaining what scammers are after (passwords, financial info, identity, money) and the psychological triggers they exploit — urgency, greed, curiosity, and fear.

■ Brief Description

The Phish Tank Simulator is an interactive cybersecurity awareness web application designed to teach everyday users how to recognize and avoid phishing attacks.

What It Does

The app presents users with realistic, simulated phishing emails and scam SMS messages — modelled after real-world attack patterns. Users must actively identify and click on red flags hidden within each message to score points and progress through rounds.

How It Works

- Each round displays a fake phishing email or scam text on screen
- Users click on suspicious elements — such as urgent language, fake sender addresses, or misleading content — to catch the phish
- Correct catches earn points; missed flags cost a life
- After each round, a debrief explains why each element was dangerous

Why It Matters

Phishing is responsible for over **80% of reported cybersecurity incidents** worldwide. Most victims are not fooled by technical exploits — they are manipulated through psychological tricks like urgency, authority, and impersonation. The Phish Tank Simulator trains users to slow down, think critically, and recognize these tactics before they cause real harm.

Key Features

- ■ Gamified learning with scoring, lives, and difficulty levels
- ■ 20+ realistic phishing scenarios across email and SMS
- ■ Badge system and leaderboard for motivation
- ■ Instant educational feedback after every round
- ■ Fully browser-based — no installation required

Target Audience

Students, employees, senior citizens, and anyone who uses email or a smartphone — essentially everyone who could be a target of a phishing attack.
